Routledge
This brand
new resource
provides a
solid,

comprehensive and accessible foundation in neurosciences for undergraduates and pre-registration postgraduate students. Using a multidisciplinary approach, it will guide students in their understanding of the most commonly found problems in neurological rehabilitation and inform their clinical practice. The book starts with the foundation of basic neurosciences

, covering the normal function and structure of the nervous system from the organism as a whole through to the molecular level. It also introduces perceptuo-motor control and learning - topics that lie at the heart of rehabilitation. The book then goes on to discuss problems that allied health professionals commonly encounter in neurological rehabilitation. Topics covered include problems with

perception and movement, planning, attention and memory, communication, motivation and emotion, sleep, continence and sexuality. The book also introduces key theories and evidence underpinning both behavioural and pharmacotherapeutic interventions used in neurological rehabilitation. The book closes by summarising current principles underpinning

best practice and also looks to the future by identifying gaps in evidence-based practice with ideas for future research and what the future may hold for neurological rehabilitation. Throughout, a variety of supplementary information boxes point towards additional material such as Case Studies which highlight the clinical relevance of topics discussed; and a variety of Research

Boxes which refer to more advanced material and/or original research studies. Each chapter ends with self-assessment questions which will check progress and prompt students to reflect on how the information presented in the chapter could be applied to clinical practice. Written by a multidisciplinary team, highly experienced in teaching, research and

clinical practice Lays the foundation of basic neurosciences for allied health students Accessible and comprehensive text Introduces students to key theories and evidence underpinning neurological rehabilitation Focuses on clinically relevant information End of chapter self-assessment questions of different levels of complexity *The Neurosciences and the*

Practice of Aviation Medicine
Routledge
This book presents the latest neuroscience research on mindfulness meditation and provides guidance on how to apply these findings to our work, relationships, health, education and daily lives. Presenting cutting-edge research on the neurological and cognitive changes associated with its practice Tang aims to explain how it

reaps positive effects and subsequently, how best to undertake and implement mindfulness practice. Mindfulness neuroscience research integrates theory and methods from eastern contemplative traditions, western psychology and neuroscience, and is based on neuroimaging techniques, physiological measures and behavioural tests. The Neuroscience of Mindfulness Meditation

begins by explaining these foundations and then moves on to themes such as the impact of personality and how mindfulness can shape behaviour change, attention and self-control. Finally, the book discusses common misconceptions about mindfulness and challenges in future research endeavours. Written by an expert in the neuroscience of mindfulness

this book will be valuable for scholars, researchers and practitioners in psychotherapy and the health sciences working with mindfulness, as well as those studying and working in the fields of neuroscience and neuropsychology. *The Instructional Leader and the Brain* Oxford University Press Over the past 30 years, findings in the neurosciences have grown

exponentially and have provided a profound understanding of the link between behavior and biology. Although the Social Work community has long taken pride in using a bio-psycho-social-spiritual (BPSS) framework in conceptualization and intervention, the biological aspect of this BPSS framework has been sorely missing. Neuroscience and Social Work Practice provides the

critical missing link. Introducing the latest neuroscience research, it gives practitioners essential data—in an easily accessible form—with which to take on the challenges of increasingly complex human problems and diagnoses. Key Features Takes readers on a "tour of the brain" and makes dense scientific material more engaging Provides a framework for how human

service professionals can understand and implement neuroscience clinical data with the use of the Transactional Model Uses case vignettes to explain how neuroscience findings have been applied to specific practice situations Offers a deeper understanding of the links between neuroscience research and social work in such areas as trauma, attachment, psychotherapy , substance abuse, and the effects of psychotropic medications Intended Audience This cutting-edge text is indispensable for practitioners in the human services field and is an essential supplement for upper-level undergraduate or graduate students of courses in Human Behavior in the Social Environment and Social Work Direct Practice as well as courses on Interpersonal Practice with Individuals, Children, and Families. Neuroethics SAGE Publications Recent advances in the brain sciences have dramatically improved our understanding of brain function. As we find out more and more about what makes us tick, we must stop and consider the ethical implications of this new found knowledge. Will having a new biology of the brain through imaging make

us less responsible for our behavior and lose our free will? Should certain brain scan studies be disallowed on the basis of moral grounds? Why is the media so interested in reporting results of brain imaging studies? What ethical lessons from the past can best inform the future of brain imaging? These compelling questions and many more are tackled by a distinguished group of

contributors to this, the first-ever volume on neuroethics. The wide range of disciplinary backgrounds that the authors represent, from neuroscience, bioethics and philosophy, to law, social and health care policy, education, religion and film, allow for profoundly insightful and provocative answers to these questions, and open up the door to a host of new ones. The

contributions highlight the timeliness of modern neuroethics today, and assure the longevity and importance of neuroethics for generations to come. *Neuroscience for Social Work* American Psychiatric Pub Coaching Brain in Mind Foundations for Practice David Rock and Linda J. Page, PhD Discover the science behind brain-based coaching By understanding

how the brain works, coaching professionals can better tailor their language, strategies, and goals to be in alignment with an individual's "hard-wired" way of thinking. Written by two well-known coaching professionals, David Rock and Linda Page, *Coaching with the Brain in Mind* presents the tools and methodologies that can be employed by novice and experienced

coaches alike to create an effective and ultimately more rewarding relationship for both coach and client. This informative guide to the neuroscience of coaching clearly demonstrates how brain-based coaching works in practice, and how the power of the mind can be harnessed to help an individual learn and grow. Illustrated with numerous

case examples and stories, this book is organized for immediate use by professionals in their client work. Coverage includes: A succinct but comprehensive overview of the major scientific and theoretical foundations for coaching and their implications for practice. Neuroscience is a multidisciplinary research area that evaluates the structural and organizational function of the nervous system. When applied to business practices, it is possible to investigate how consumers, managers, and marketers makes decisions and how their emotions may play a role in those decisions. Applying Neuroscience

to Business Practice provides theoretical frameworks and current empirical research in the field. Highlighting scientific studies and real-world applications on how neuroscience is being utilized in business practices and marketing strategies to benefit organizations, as well as emergent business and management techniques being developed from this

research, this book is a pivotal reference source for researchers, managers, and students. *Neuroscience and Social Work Practice* OUP Oxford The past two decades have seen unparalleled developments in our knowledge of the brain and mind. However, these advances have forced us to confront head-on some significant ethical issues regarding our application of this

information in the real world- whether using brain images to establish guilt within a court of law, or developing drugs to enhance cognition. Historically, any consideration of the ethical, legal, and social implications of emerging technologies in science and medicine has lagged behind the discovery of the technology itself. These delays have caused problems in the acceptability

and potential applications of biomedical advances and posed significant problems for the scientific community and the public alike - for example in the case of genetic screening and human cloning. The field of Neuroethics aims to proactively anticipate ethical, legal and social issues at the intersection of neuroscience and ethics, raising questions about what the brain tells

us about ourselves, whether the information is what people want or ought to know, and how best to communicate it. A landmark in the academic literature, the Oxford Handbook of Neuroethics presents a pioneering review of a topic central to the sciences and humanities. It presents a range of chapters considering key issues, discussion, and debate at the intersection of

brain and ethics. The handbook contains more than 50 chapters by leaders from around the world and a broad range of sectors of academia and clinical practice spanning the neurosciences, medical sciences and humanities and law. The book focuses on and provides a platform for dialogue of what neuroscience can do, what we might expect neuroscience will do, and

what neuroscience ought to do. The major themes include: consciousness and intention; responsibility and determinism; mind and body; neurotechnology; ageing and dementia; law and public policy; and science, society and international perspectives. Tackling some of the most significant ethical issues that face us now and will continue to do so over the coming decades, The

Oxford Handbook of Neuroethics will be an essential resource for the field of neuroethics for graduate students and postdoctoral fellows, basic scientists in the neurosciences and psychology, scholars in humanities and law, as well as physicians practising in the areas of primary care in neurological medicine. Sociological Reflections on the Neurosciences Springer

The neurosciences are more than a collection of scientific practices - they offer up various ways of thinking about mind, body and society. This title casts light on the place, role and impact of neuroscience. It reflects on the insights the neurosciences have to offer sociology. *Applying Neuroscience to Business Practice* Oxford University Press At last, a hands-on

the voices of educators and scientists to argue for a new field of enquiry: neuroeducational research. Basic Principles of Chiropractic Science & Business Media This book is an introduction to the biological basis of behavior, broadly defined, with practical applications for higher education programs that focus on advances in neuroscience. It has a

special focus on training practitioners based on American Psychological Association (APA) health service psychology guidelines. It reviews and digests information for clinical, counseling, and school psychologists serving clients of all ages in a variety of settings, such as schools, hospitals, and clinics. Content for all developmental stages, including birth to geriatric practices are highlighted.

Some unique features of this book include: The integration of neuropsychological and theoretical foundations for clinical practice. Comprehensive consideration of projective, objective, and interviewing measures. Recent research in neuroimaging as it relates to clinical practice. Psychopharmacology and its effect within the neurosciences. Assessment for intervention in

clinical, counseling, school, and neuropsychology. The use of research to guide neuropsychologically-based clinical practice. Eastern and western approaches to integration and case conceptualization. Interventions driven by brain-based scientific understanding. A variety of neuropsychological cases and report styles to improve practice The enduring contribution of

psychology into modern times will remain contingent on practitioners' commitment to ethically-based, empirically-focused, evidence-based practice; continuing education; and scientific discovery. This book will help health service psychologists and counselors to meet the needs of an increasingly diverse population by providing cutting-edge, evidence-

based, ecologically valid neuropsychological interventions currently lacking within the field. Cultural considerations are provided within each chapter, which is especially important given societal inequity that continues to persist within our world. Implications for the COVID-19 pandemic are also discussed in light of neuroscientific advances in medicine. **Successful Private**

Applied Neurosciences for the Allied Health Professions

SAGE Publications, Incorporated Apply neuroscience to leadership and become a gamechanger An

instructional leader who understands how people learn has the power to transform a school and raise student achievement. Brain pioneer Margaret Glick weaves the fields of cognitive science, educational leadership, and instruction into a cohesive framework for

understanding the benefits of how the brain learns: Increased understanding of the learning process Improved communication Enhanced relationships Better interpersonal skills New tools for giving effective feedback An inner compass for continuous improvement Included are brain illustrations, rubrics, implementation ideas for teachers, step-by-step pedagogy, and

assessments. **Applications of Neuroscience** Springer Nature Fully updated and revised, the second edition of The Practice of Emergency and Critical Care Neurology puts a more modern approach on the practice of emergency neurological care. When most texts within the field focus on the theoretical aspects, this book concentrates on the management of neurologic

conditions, recognition of deterioration of neurologic functions, neurosurgical procedures, and immediate interventions. This text also presents hard data to explain why we do what we do. Dr. Wijdicks condenses essential information into several sections comprising of the principles in recognizing critically ill neurologic patients in the emergency department, the evaluation of symptoms

indicating critical emergency, general principles of managing critically ill patients, monitoring devices and diagnostic tests, complete management of specific disorders in the neurosciences intensive care unit, postoperative neurosurgical and neurointerventional complications, management of medical complications, and end of life care. Key Features of

the New Edition include 1. Additional chapters on critical consults in surgical and medical ICUs, critical care management, and comprehensive monitoring and biomarkers to reflect new research; 2. Rich illustrations using color photos of patients and drawings of important basic concepts of mechanism of acute neurologic disease; 3. Fully updated and comprehensive

e reference list; 4. A pocket book of selected tables and figures covering all essential points for quick reference and as a survival guide for house staff. This is the go-to guide for every physician, staff neurologist, neurointensivist, resident, and fellow in training with managing acutely ill neurologic patients. **Coaching with the Brain in Mind**

physicians from varied specialties. Trauma-Informed Care CRC Press This accessible book provides an overview of trauma-informed care and related neuroscience research across populations. The book explains how trauma can alter brain structure, identifies the challenges and commonalities for each population, and provides emergent treatment intervention

options to assist those recovering from acute and chronic traumatic events. In addition, readers will find information on the risk factors and self-care suggestions related to compassion fatigue, and a simple rubric is provided as a method to recognize behaviours that may be trauma-related. Topics covered include: children and trauma adult survivors of trauma

military veterans and PTSD sexual assault, domestic violence and human trafficking compassion fatigue. Trauma-Informed Care draws on the latest findings

from the fields of neuroscience and mental health and will prove essential reading for researchers and practitioners. It will also interest clinical social workers and

policy makers who work with people recovering from trauma.
