Bachelor Thesis from the year 2014 in the subject Business economics - Supply, Production, Logistics, grade: 1,0, Cologne University of Applied Sciences, course: Supply Chain Management, language: English, abstract: Everyday thousands of containers are shipped worldwide in order to fulfil customer orders in time. Nowadays focusing only on domestic markets is no longer an option for achieving long-term business success as global competition forces companies to recognise the need for superior design, planning, operation, and coordination of their supply chain activities. These are strongly supported by the rapid progress of information technologies. This thesis aims at establishing the importance of information and its effects on supply chain management, thereby pointing out key aspects that technology plays in managing information. It is structured in the following way: The first chapter defines the relevant terminologies helpful in understanding the overall topic. The second chapter moves on to describe in greater detail the effective management of information flows and their relevance for the three supply chain macro processes. Before proceeding to examine information technologies; chapter 3 deals with the collaborative planning, forecasting, and replenishment approach in order to outline a framework for information exchange along the supply chain. In chapter 4 it is then necessary to discuss the impact of information technologies on facilitating the management of supply chain activities and processes. The fifth chapter follows from the previous one by establishing how technology facilitates the physical movement and storage of inventory in warehousing by addressing the most used supply chain software: warehouse management systems. The final chapter summarises the main results of this thesis.

The Characteristics of Supply Chain Management. An Annotated Bibliography Review Pearson UK

Academic Paper from the year 2018 in the subject Business economics - Business Management, Corporate Governance, grade: A-, Kenyatta University, course: Business Management, language: English, abstract: Over the past years, Supply Chains (SC) and Supply Chain Management (SCM) have been noted to play a crucial role in corporate efficiency, not to mention that they have immensely attracted the attention of several scholars. Due to the cropping up of liberalization as well as the globalization of the international trade, the production factors involved in sourcing and consumer products from destinations across the globe have enhanced the interdependence between the producers and wholesalers on the global supply chains. Accordingly, the literature behind supply chain management has offered a number of variations on the same theme in supply chain definition. In simple terms, supply chain management can

be defined as a system of suppliers, retailers, customers, distributors and even manufacturers, whereby the products flow downstream from the suppliers to the consumers while information flows in both directions. On the other hand, a supply chain can be defined as a network of facilities as well as distribution options that operate to procure materials and transform these materials into intermediate and finished products, alongside distributing these finished products to consumers. Evidently, supply chains exist in the service and even manufacturing enterprises, even though the chain's complexity may greatly vary from firm to firm and industry to industry.
